

An Agentic AI Flow for Alert Correlation in Enterprise Networks

Cheng-Yun King Yang, Dongyan Xu
Purdue University, West Lafayette

Problem: Alert Correlation

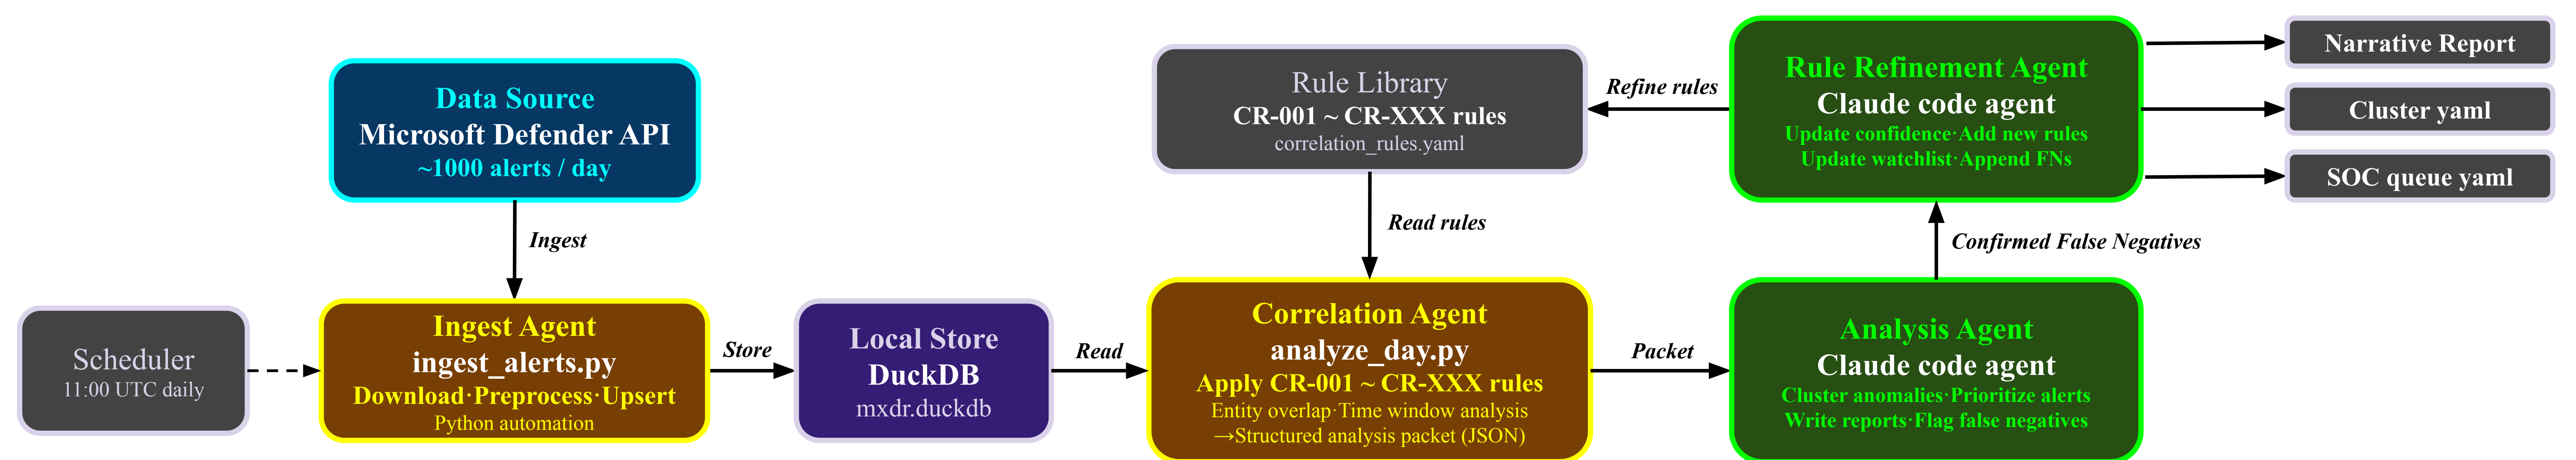

ALERT CORRELATION: UNMASKING COMPLEX APT ATTACKS

Current Solution in Enterprise

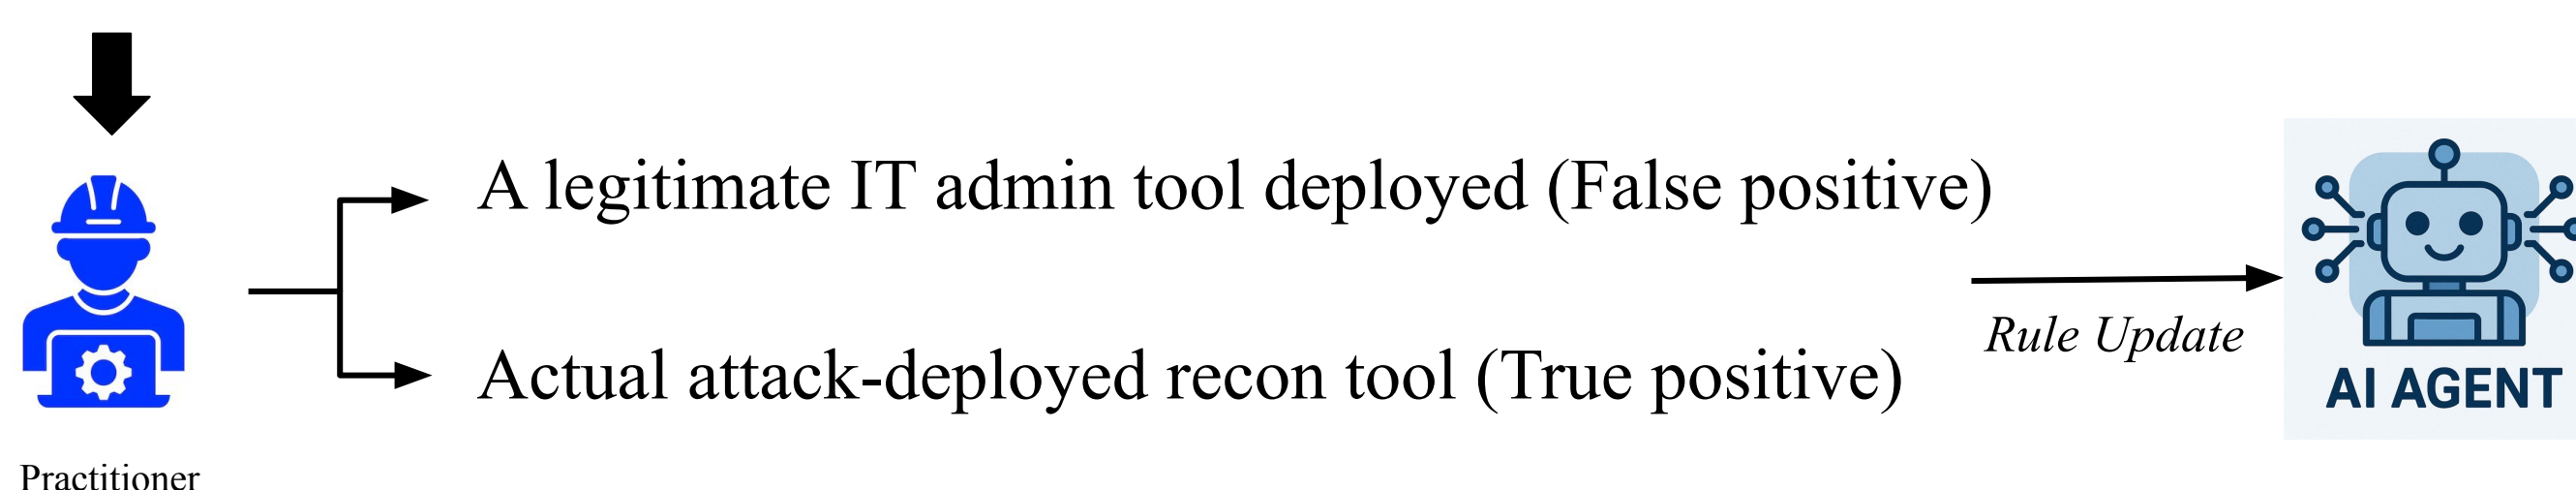

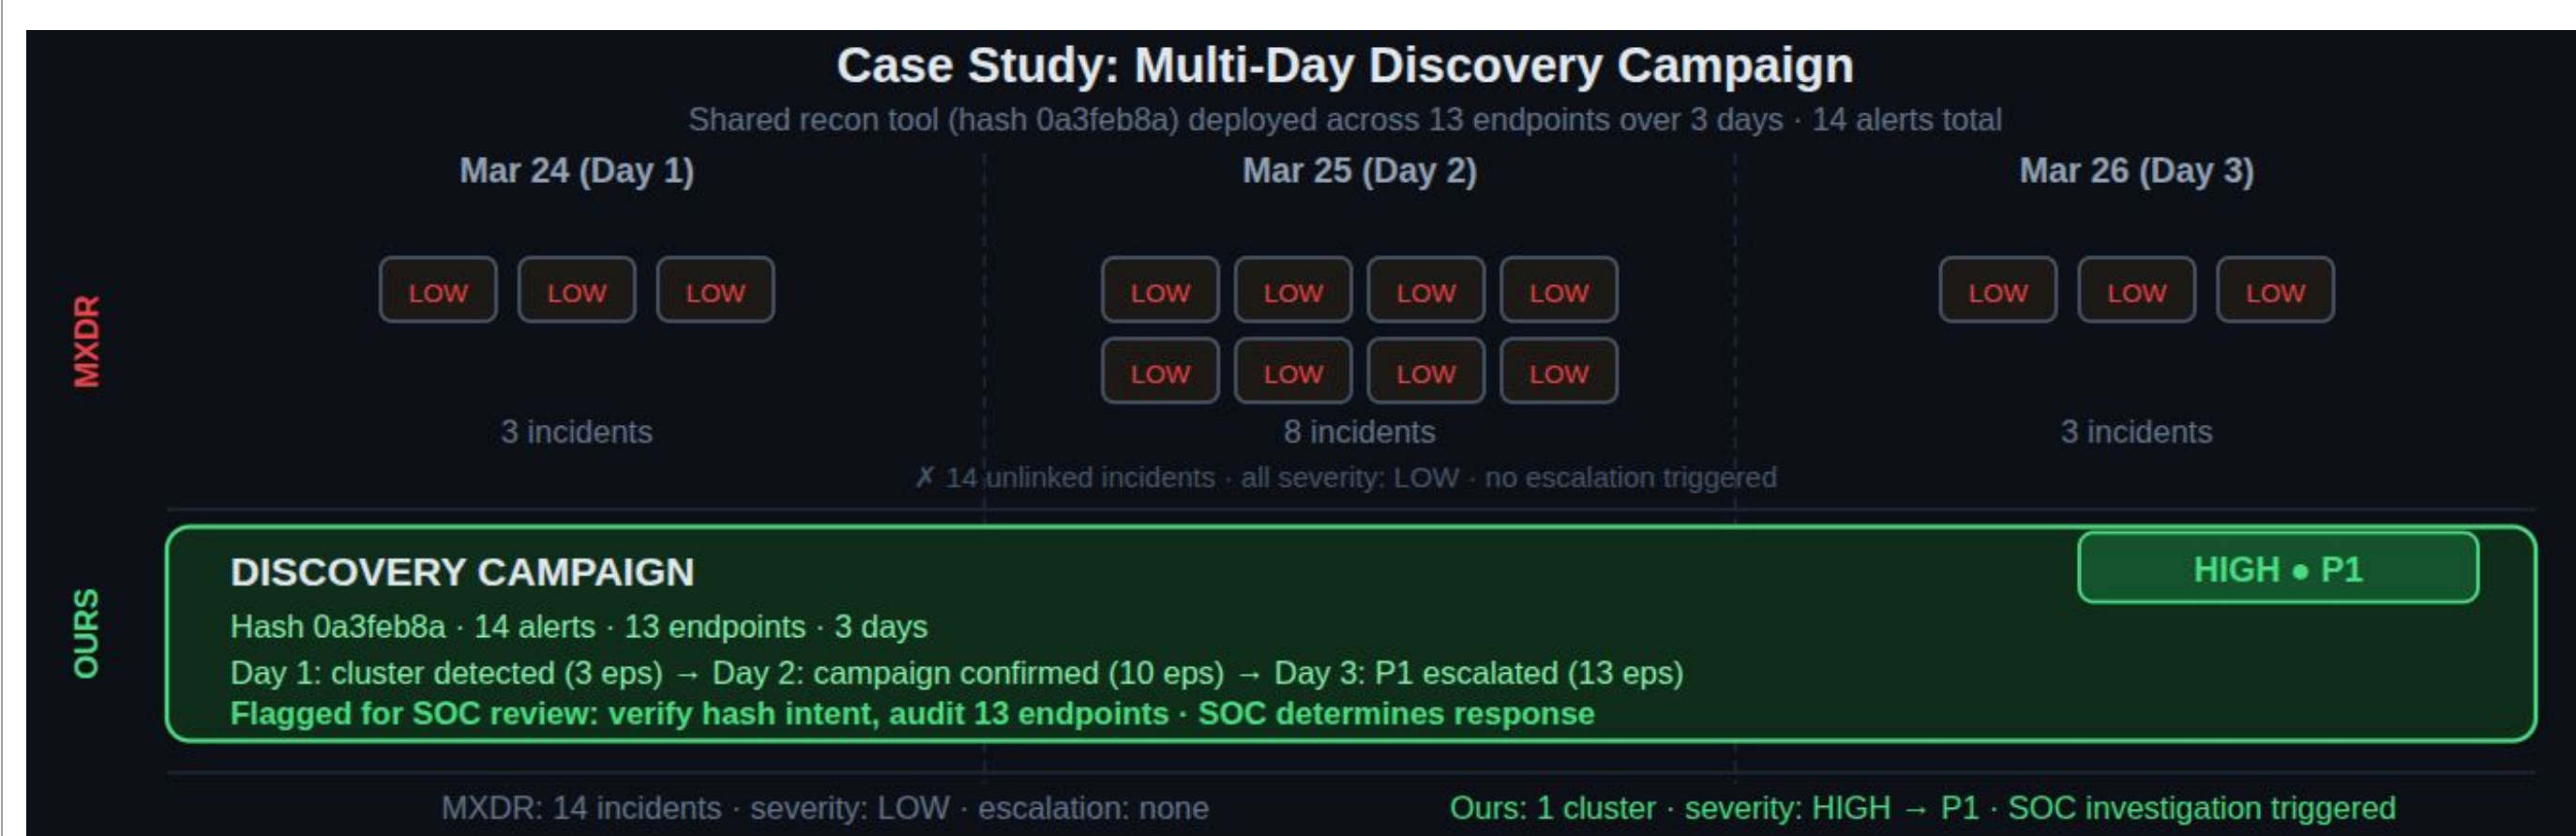

- Microsoft Managed Extended Detection and Response (MXDR)
 - MXDR is a 24/7 managed security service that integrates endpoint, identity, and cloud data to proactively hunt, correlate, and respond to cyber threats.
- Limitations
 - ★ **High False Alarms** - 80% of the correlations are incorrect
 - ★ **Short Correlation Time Windows** - miss long-lasting APTs
 - ★ **Not Self-Improving** - update manually with static rules
 - ★ **Not Customizable to Specific Enterprise** - Practitioners need to manually add rules based on their experience
- MXDR correlation results still require heavy manual analysis and tracing by security engineers!**

Agentic AI Flow for Alert Correlation

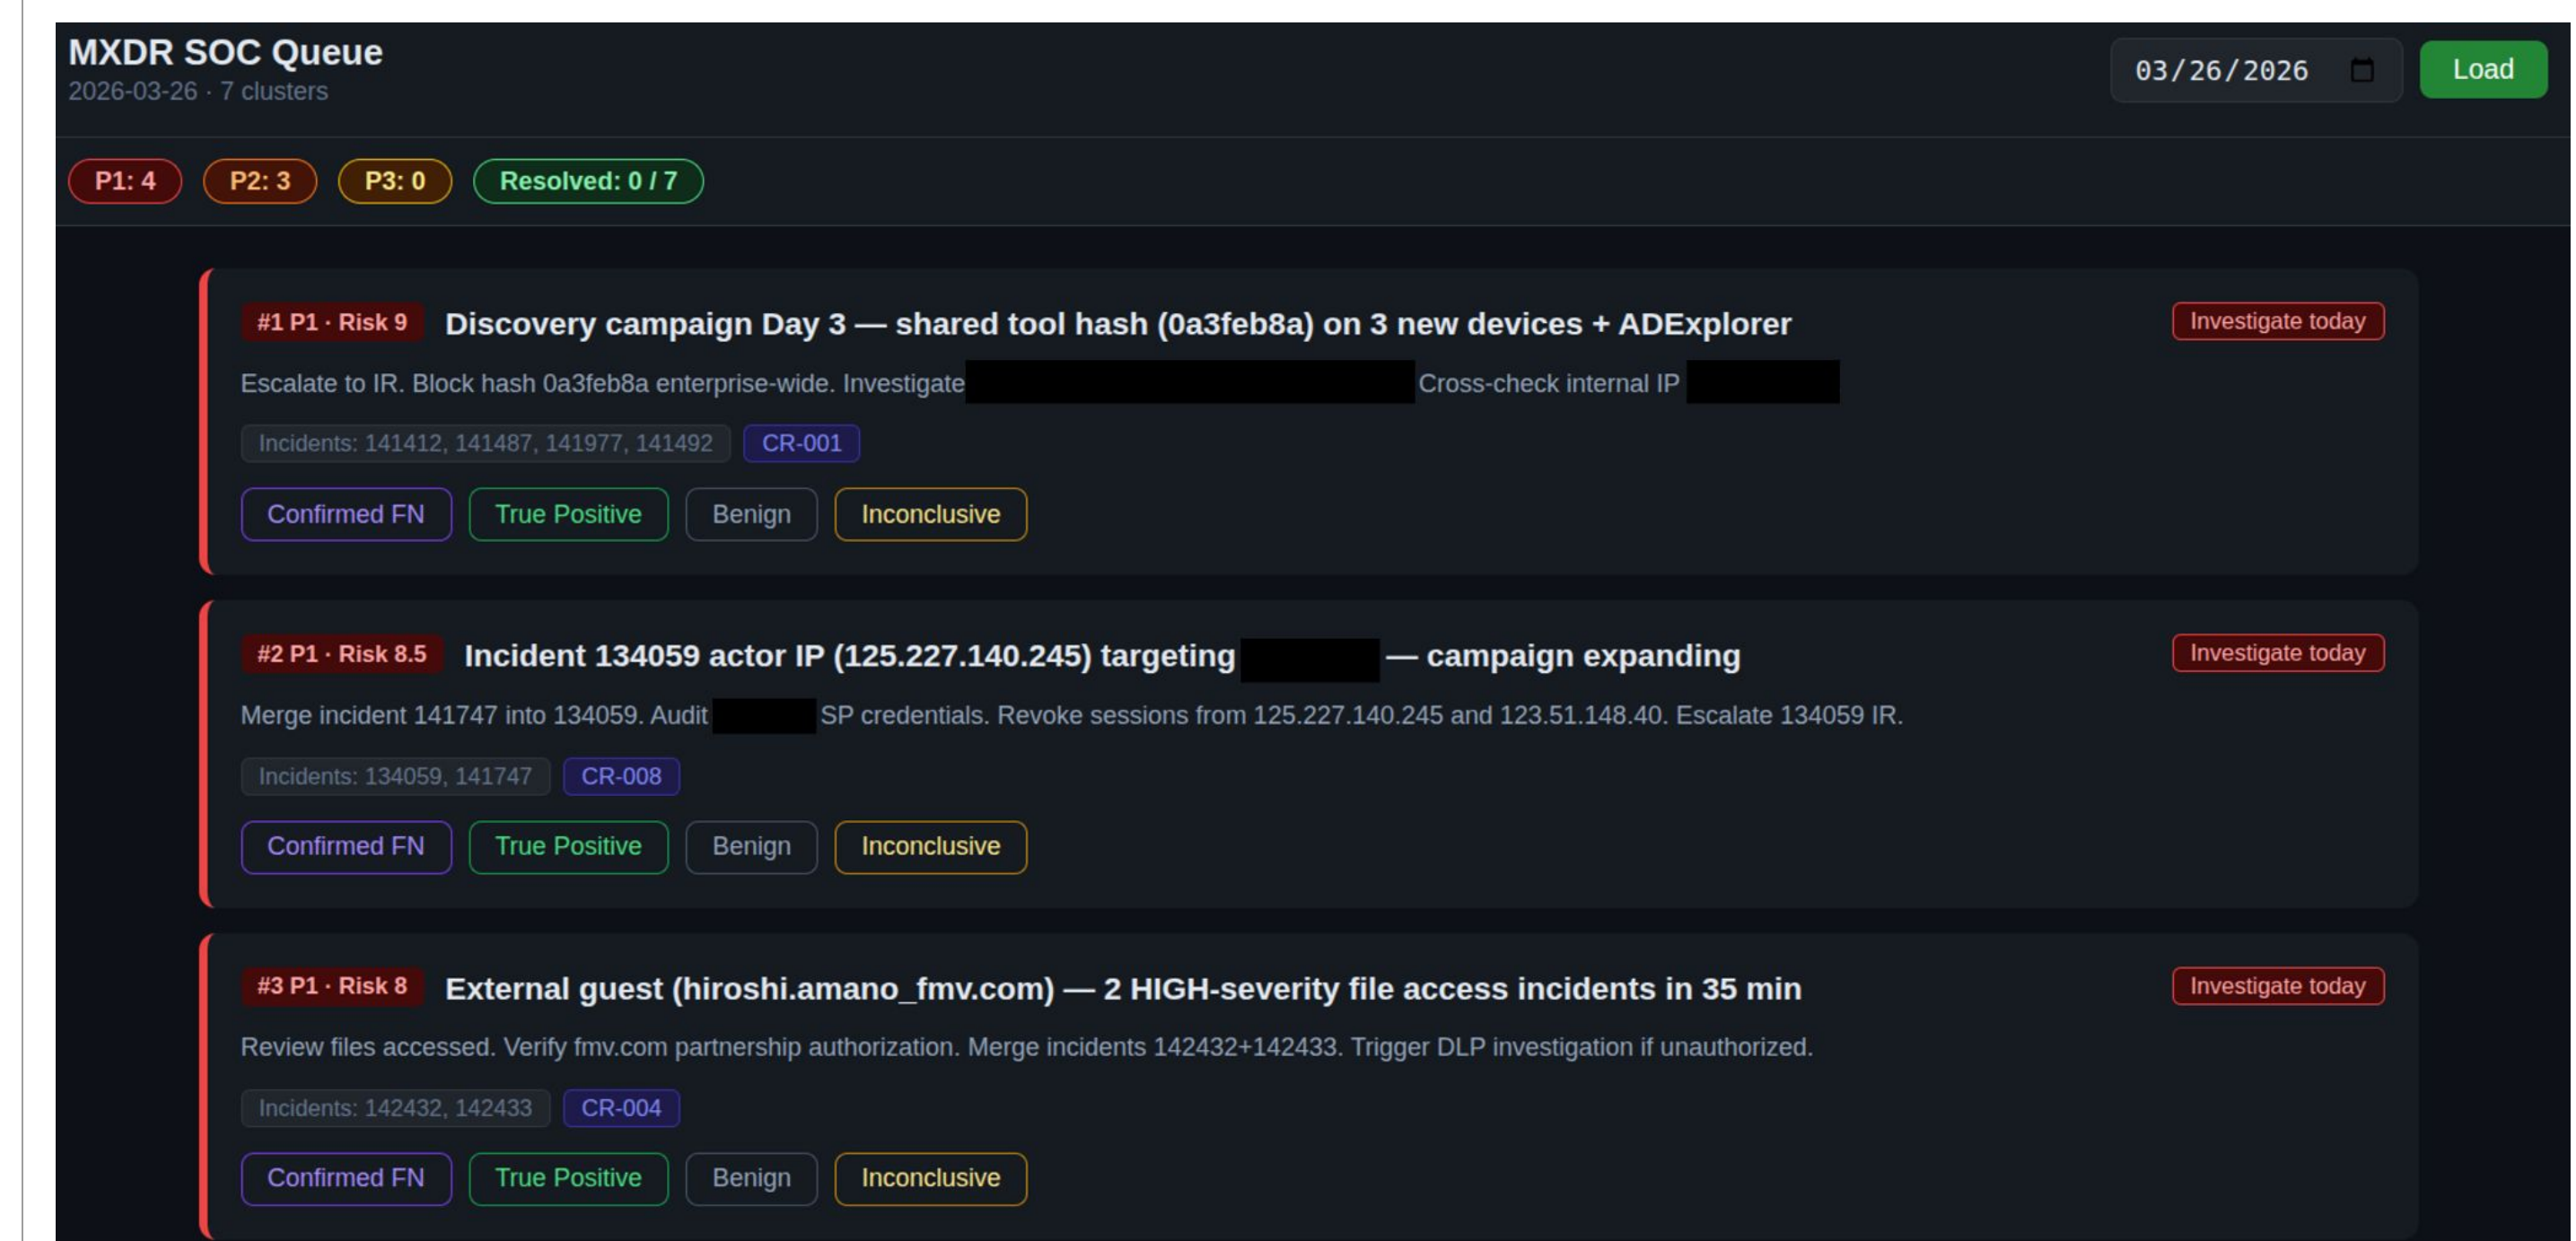

Case Study

- A suspicious pattern raised by the agent due to
 - Same file hash execute across **13 endpoints** in **3 days**
 - Classic post-compromise reconnaissance commands used
 - Unusual lateral movement between two subdomains

User Interface

- Alerts are grouped based on threat severity
